How can you enjoy quality water?

It's only natural to be concerned about the quality of the water that comes into your home. After all, your family drinks it, cooks with it and showers with it. It's used to wash your dishes, bedding and clothes. And if certain impurities aren't removed, water can stain your sinks, showers and tubs, etch your glassware, ruin your clothes, and corrode your plumbing and appliances. Worse still, unconditioned water can also have an unpleasant smell and taste. That's why so many families are turning to an EcoWater whole home system for cleaner, better tasting water.

How the EcoWater Whole Home System Works

1. Water entering your home flows through the EcoWater water conditioner/refiner where impurities are removed through softening, filtering or refining.

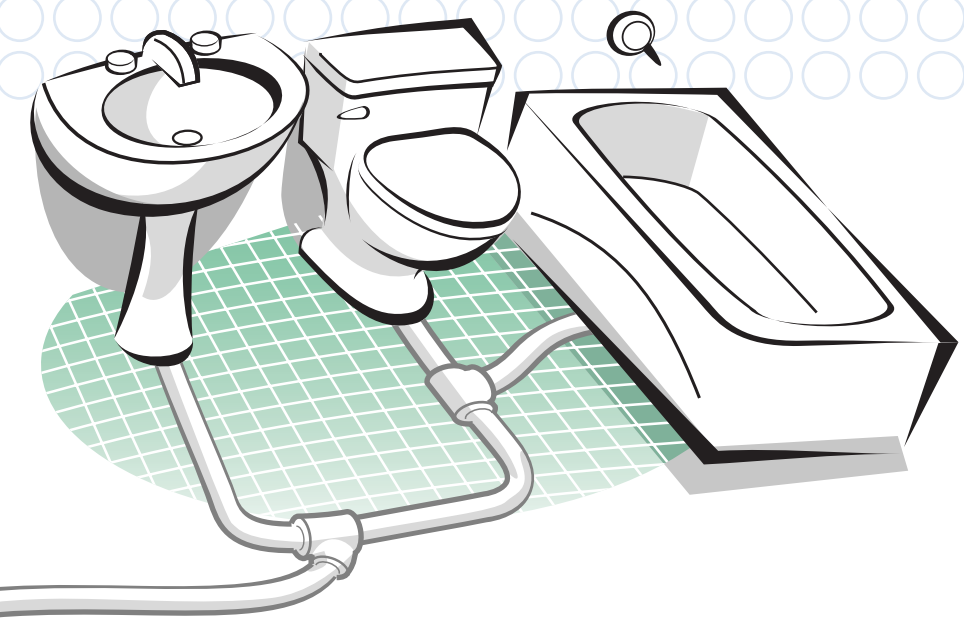

3. Your drinking water faucet comes with an optional EcoWater monitor that lets you know when filter cartridges need to be replaced.

2. Water that's used for drinking, making ice cubes and humidifying your home is further filtered by the EcoWater reverse osmosis filter, where most dissolved solids are removed.

You'll Notice the Difference from Day One

- Clean, better-tasting water flows from every faucet in your home.
- No more bad tastes and odors in the water used for drinking, cooking and cleaning.
- Save money by eliminating the need for expensive bottled water.
- Treated water helps skin and hair feel better.
- Laundry comes out brighter, cleaner and softer.
- Spotting of dishes and glassware is reduced.
- Showers, tubs and sinks are easier to clean due to decreased soap residue.
- Water heater efficiency is improved, resulting in energy savings.
- Scale build-up in pipes and appliances is reduced.

With EcoWater's exclusive and advanced electronics, you can monitor the status of your Series 3000 water conditioner/refiner from anywhere in the house. This convenient, patented feature is available only from EcoWater Systems.

Our Three Step Approach to Cleaner Water

Step 1: The Series 3000 Water Conditioner/Refiner

The Series 3000 water conditioner/refiner provides you with clean, conditioned water on demand. Its electronic brain keeps track of past water usage and calculates the amount of water you'll need the next day. So it automatically regenerates only as needed, saving salt and water. It also comes with a remote monitor that alerts you when the system needs salt or service.

Step 2: Reverse Osmosis Drinking Water System

EcoWater's RO system provides clean, clear, better tasting drinking water with the convenience and economy of using a tap. Through its advanced filtering, it removes up to 95% of the total dissolved solids in your water. This compact system requires little space, has fewer connections and is designed to let you change filters quickly and easily.

Step 3: Optional LifeLite Electronic Water Quality Monitor

Attached to the base of your drinking water faucet, the LifeLite monitor lets you know at a glance that the water you use to drink, cook or mix into baby formula is the cleanest possible. When the filter needs to be changed, the red light flashes. When a membrane needs to be replaced, the yellow light flashes.
